

Health Insurance Coverage: Estimates from the National Health Interview Survey, 2004

by Robin A. Cohen, Ph.D., and Michael E. Martinez, M.P.H., Division of Health Interview Statistics, National Center for Health Statistics

Highlights

- State-level estimates of persons who are currently uninsured, have public coverage, or have private coverage were added to this release for 10 States.
- Two additional questions were added to the health insurance section of the National Health Interview Survey (NHIS) beginning with quarter 3 of 2004 to improve the accuracy of the estimates. Therefore, some estimates reported here are not directly comparable with estimates previously published.
- In 2004, 42.1 million persons of all ages (14.6%) were uninsured at the time of the interview, 51.6 million (17.9%) had been uninsured for at least part of the year prior to the interview, and 29.2 million (10.1%) had been uninsured for more than a year at the time of the interview.
- For children under age 18 years, the percentage who were uninsured at the time of the interview was 9.4% in 2004, which continues the decline observed since 1997.
- In 2004, 69.4% of poor children and 43.8% of near poor children were covered by a public health plan at the time of interview. From 1999 through 2003, the estimates of public coverage increased among children, but the largest increase was seen among near poor children. During the same period, there was a decreasing trend in the percentage of poor and near poor children with private coverage. However, the differences in the estimates of private or public coverage between 2003 and 2004 for children were not statistically significant.
- In 2004, more than 59% of currently unemployed adults and 21% of employed adults aged 18–

64 years had been uninsured for at least part of the past year, and 32.5% of currently unemployed adults and 12.7% of employed adults had been uninsured for more than a year.

- In 2004, 1 in 20 children in Michigan, New York, and Ohio were uninsured at the time of interview compared with the national average of nearly 1 in 10 children currently lacking health insurance coverage.

Introduction

The Centers for Disease Control and Prevention's (CDC) National Center for Health Statistics (NCHS) is releasing selected estimates of health insurance coverage for the civilian noninstitutionalized U.S. population based on data from the 2004 National Health Interview Survey (NHIS), along with comparable estimates from the 1997–2003 NHIS. Three types of measures of lack of health insurance coverage are provided: current (uninsured at the time of interview), intermittent (uninsured at least part of the 12 months prior to interview), and long term (uninsured for more than a year at the time of interview). Different timeframes are used to measure lack of insurance coverage to reflect different policy-relevant perspectives. The measure of current lack of coverage provides an estimate of persons who at any given time may experience barriers to obtaining needed health care. The estimate of persons who were uninsured at any time in the past year provides an annual caseload of persons who may experience these barriers. This measure includes persons who have insurance at the time of interview, but had a period of noncoverage in the year prior to interview. Finally, the measure of lack of coverage for more than a year provides an estimate of those with a persistent lack of

coverage who may be at high risk of not obtaining preventive services as well as care for illness and injury. These three measures of lack of coverage are not mutually exclusive, and a given individual may be counted in more than one of the three measures.

The 2004 health insurance estimates are being released prior to final data editing and final weighting to provide access to the most recent information from the NHIS. The resulting estimates for persons without health insurance are generally 0.1–0.2 percentage points lower than those based on the editing procedures used for the final data files. Estimates for 2004 are stratified by age group, sex, race/ethnicity, poverty status, marital status, employment status, region, and educational attainment.

New for this release are State-level estimates of current lack of health insurance, public coverage, and private health insurance coverage for the 10 largest States in terms of population. These estimates are included to provide current tracking information for States where the NHIS sample is large enough to produce estimates. There may be other States that also have reliable estimates that are not included in this report. Users should note that these estimates may vary from other State-level estimates, such as those produced by the Current Population Survey (1), because of differences in questions, timing of administration of the questionnaire, and the context of the survey. They are included in this report as an additional tracking source for analysts, allowing users to examine data for these 10 States in parallel with the national data collected with the same methods. This report is produced by the NHIS Early Release (ER) Program, which releases updated selected estimates quarterly on the NCHS Web site (<http://www.cdc.gov/nchs/nhis.htm>).

Two additional questions were added to the health insurance section of the NHIS beginning with quarter 3 of 2004 to reduce potential errors in reporting Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage. Persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage. Respondents who were reclassified as covered by the additional questions received appropriate followup questions concerning periods of noncoverage for insured respondents. For this report, 2004 estimates that did not use the two additional questions are labeled *Method 1* and estimates that did use the additional questions are labeled *Method 2*. Figures and text based on only 2004 data present estimates calculated using Method 2. Figures and text regarding trends based on previous years through 2004 present estimates calculated using Method 1. Further discussion of these methods and implications of these changes are presented in the "Technical Notes" section of this report.

Data Source

The data are derived from the Family Core components of the 1997–2004 NHIS, which collects information on all family members in each household. Data analyses for the 2004 NHIS were based on 94,460 persons in the Family Core. The NHIS is a multistage probability sample survey of the civilian noninstitutionalized population of the United States. It is conducted continuously throughout the year for NCHS by interviewers of the U.S. Census Bureau. Visit the NHIS Web site

(<http://www.cdc.gov/nchs/nhis.htm>) for more information on the design, content, and use of the NHIS.

The NHIS is a comprehensive health survey that can be used to relate health insurance coverage to health outcomes and health care utilization. It has a low item nonresponse rate (about 1%) for the

Figure 1. Percent of children under 18 years of age who lacked health insurance coverage at the time of interview for at least part of the year or for more than a year: United States, 1997-2004.

DATA SOURCE: Family Core component of the 1997-2004 National Health Interview Surveys.

Figure 2. Percent with health insurance coverage by type of insurance among persons under 65 years of age, by age group: United States, 2004.

DATA SOURCE: Family Core component of the 2004 National Health Interview Survey.

insurance questions. Because the NHIS is conducted throughout the year, yielding a nationally representative sample each week, data can be analyzed weekly or quarterly to monitor health insurance coverage trends. For a more complete description of the estimation procedures and definitions of selected terms, see the "Technical Notes" section of this report.

Results

Lack of health insurance coverage

For 2004, the percentage of uninsured persons at the time of interview was 14.6% (42.1 million) for persons of all ages, 16.4% (41.7 million) for persons under age 65 years, 19.3% (34.9 million) for persons aged 18–64 years, and 9.4% (6.8 million) for children under age 18 years (tables 1 and 2) (Method 2). For working-age adults (18–64 years), the percentage who were uninsured increased from 2001 through 2003. However, the decrease between 2003 and 2004, from 20.1% to 19.4% for working-age adults (Method 1), was not statistically significant. For children under age 18 years, the percentage of those who were uninsured decreased from 1997 through 2004.

The observed decrease in the percent of uninsured persons under 65 years of age between 2003 and 2004 from 17.2% to 16.6% (Method 1) was not statistically significant.

Based on data from the 2004 NHIS, a total of 51.6 million (17.9%) persons of all ages were uninsured for at least part of the 12 months prior to interview (tables 1 and 2). Working-age adults were almost twice as likely to experience this lack of coverage compared with children under age 18 years (23.1% and 12.7%) (Method 2). The percentage of children uninsured during at least part of the past year decreased from 18.1% in 1997 to 12.9% in 2004 (Method 1) (figure 1). However, the decreasing trend was not observed among adults aged 18–64 years. The observed decrease in the percentage of children who lacked

Figure 3. Percent with health insurance coverage by type and percent uninsured at the time of interview for near poor children under 18 years: United States, 1997-2004.

DATA SOURCE: Family Core component of the 2004 National Health Interview Survey.

coverage for at least part of the 12 months prior to interview, from 13.7% in 2003 to 12.9% in 2004 (Method 1) was not statistically significant.

Data from 2004 also revealed that 11.4% (28.9 million) of persons under age 65 years (13.8% of adults and 5.4% of children) had been uninsured for more than a year at the time of the interview ([tables 1 and 2](#)) (Method 2). Compared with 2002, an additional 3.1 million working-age adults had been uninsured for more than a year in 2004 (Method 1). The percentage of children uninsured for more than a year decreased from 8.4% in 1997 to 5.3% in 2003. The slight increase between 2003 and 2004, from 5.3% to 5.4% (Method 1) was not statistically significant ([figure 1](#)). Children were less likely than working-age adults to be uninsured for more than a year ([figure 2](#)).

Public and private coverage

For 2004, 16.2% of persons under age 65 years were covered by public health plans, and 68.6% were covered by private health insurance plans ([table 3](#)). For both adults and children, from 1999 through 2004, the percentage with public coverage increased (Method 1). However, the differences in the estimates of private or public coverage between 2003 and 2004 for both adults and children were not statistically significant. In 2004, 70.9% of adults under age 65 were covered by a private plan compared with 63.1% of children under 18 years ([figure 2](#)) (Method 2). More than one-fourth of children (28.7%) were covered by a public plan compared with 11.1% of adults under age 65 years.

Insurance coverage by poverty status

For 2004, 14.7% of poor children and 15.1% of near poor children (see [Technical Notes](#) for definition of poverty) did not have health insurance coverage at the time of interview ([table 4](#)). The percentage that was uninsured among poor children

decreased from 1997 through 2004. The percentage that was uninsured among near poor children decreased from 1997 through 2003. However, the increase between 2003 (14.7%) and 2004 (15.5%) (Method 1) was not statistically significant. During 1998–2004, the percentage of uninsured people remained stable for adults who were poor. However, the percentage of uninsured, near poor adults at the time of interview significantly decreased from 39.5% in 2003 to 36.9% (Method 1) in 2004.

Based on 2004 data, 69.4% of poor children and 43.8% of near poor children were covered by a public health plan at the time of interview ([table 5](#)). For children under age 18 years, the estimates of public coverage increased over time from 1999 through 2003 among the poor, near poor, and not poor groups. However, the largest increase was seen among near poor children ([figure 3](#)). There was a significant decrease in public coverage among poor and near poor children between 2003 and 2004.

For 2004, 17.2% of poor children and 43.0% of near poor children were covered by private health insurance at the time of interview ([table 6](#)). From 1999 through 2003, the percentage of poor and near poor children with private coverage decreased. The observed increases in private coverage for poor (14.4% and 17.2%) and near poor (39.9% and 43.0%) children from 2003 through 2004 were not statistically significant. The percentage with private coverage decreased from 1997 to 2003 among near poor adults aged 18–64 years. However, the observed increase in private coverage for near poor adults age 18–64 years from 2003 through 2004 (43.7% and 46.0%) was not statistically significant. Among not poor adults aged 18–64, there was a decrease in private coverage between 2003 and 2004 (85.5% and 84.6%).

Lack of coverage, by selected demographic characteristics

Race/ethnicity

Based on data from the 2004 NHIS, Hispanic persons were more likely than non-Hispanic white persons and non-Hispanic black persons to be uninsured at the time of interview, to have been uninsured for at least part of the past 12 months, and to have been uninsured for more than a year ([table 7](#)). Approximately one-third of Hispanic persons were uninsured at the time of interview or had been uninsured for at least part of the past year, and more than one-fourth of Hispanic persons had not been covered by a health plan for more than a year.

Age and sex

For both sexes combined, the percentage of uninsured persons at the time of interview was highest among persons aged 18–24 years (29.9%) and lowest among persons under age 18 years (9.4%) ([figure 4](#)). Starting at age 18 years, younger adults were more likely than older adults to lack health insurance coverage. Among adults in age groups 18–24 years, 25–34 years, and 35–44 years, men were more likely than women to lack health insurance coverage at the time of interview.

Other demographic characteristics

Noncoverage was greatest in the South and West regions of the United States. Among adults who lacked a high school diploma, 30.9% were uninsured at the time of interview, 33.9% were uninsured for at least part of a year, and 25.6% had been uninsured for more than a year at the time of interview ([table 7](#)). More than 59% of currently unemployed adults and 21.2% of employed adults aged 18–64 years had been uninsured for at least part of the past year, and 32.5% of currently unemployed adults and 12.7% of employed adults had been uninsured for more than a year.

Married adults were less likely to lack coverage compared with those who were divorced, separated, living with a partner, or never married.

Insurance coverage in selected States

Nationally, approximately 16% of persons under age 65 lacked health care coverage at the time of interview in 2004 (table 8). However, one in four persons under age 65 in Texas lacked coverage at the time of interview. One in five persons in California and Florida under age 65 lacked health care coverage at the time of interview. Rates of noncoverage in Michigan, New York, Ohio, and Pennsylvania were lower than the national average.

Nationally, nearly 1 in 10 children lacked coverage at the time of interview in 2004. However, in Michigan, New York, and Ohio, only 1 in 20 children were uninsured at the time of interview. Of the States examined in this report, only Texas had lower rates of coverage than the national average: 18% of children lacked health insurance coverage at the time of interview in Texas.

Of the States examined for this report, public healthcare coverage for children ranged from 19.5% in New Jersey to 35.4% in California. A greater percentage of children had public healthcare coverage in California and Florida (33.4%) than nationally (28.7%).

Private healthcare coverage among the States examined for persons under age 65 was highest in Pennsylvania (77.9%) and lowest in Texas (59.1%). Private health insurance coverage for persons under age 65 in Illinois, Michigan, New Jersey, Ohio, and Pennsylvania was higher than the national overall coverage rate of 68.6%.

¹A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care.

²A year is defined as the 12 months prior to interview.

³Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting of Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage. Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents who were reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. These reclassified respondents were excluded in the tabulation of *Uninsured for more than a year* using Method 1 in 2004. See "Technical notes" for additional information.

¹The health plan category “public coverage” includes Medicaid, State Children’s Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, Medicare (disability), and military plans.

²The health plan category “private coverage” excludes plans that paid for only one type of service such as accidents or dental care. A small number of persons were covered by both public and private plans and were included in both categories.

³Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting of Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage. Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents who were reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. See “Technical notes” for additional information.

⁴The two additional questions added beginning in quarter 3 of 2004 did not affect the estimates of private coverage.

¹Poverty status is based on family income and family size using the U.S. Census Bureau's poverty thresholds. "Poor" persons are defined as those below the poverty threshold, "near poor" persons have incomes of 100% to less than 200% of the poverty threshold, and "not poor" persons have incomes of 200% of the poverty threshold or greater. The percentage of respondents with unknown poverty status was 19.1% in 1997, 23.6% in 1998, 26.4% in 1999, 27.0% in 2000, 27.1% in 2001, 28.1% in 2002, 31.5% in 2003, and 28.2% in 2004. See the NHIS Survey Description Document for years 1997-2003 (<http://www.cdc.gov/nchs/nhis.htm>) for more information on the unknown income and poverty status categories.

²A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan at the time of the interview. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care.

³Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting of Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage. Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents who were reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. See "Technical notes" for additional information.

¹A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care.

²A year is defined as the 12 months prior to interview.

³Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting of Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage. Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents who were reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. These reclassified respondents were excluded in the tabulation of *Uninsured for more than a year* using method 1 in 2004. See "Technical notes" for additional information.

⁴Education and marital status are shown only for those persons aged 18 years and over.

⁵GED is General Educational Development high school equivalency diploma.

⁶Employment status is shown only for those persons 18–64 years of age.

¹A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care.

²The category "public health plan coverage" includes Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, Medicare (disability), and military plan. A small number of persons were covered by both public and private plans and were included in both categories.

³The category "private health insurance" excludes plans that paid for only one type of service such as accidents or dental care. A small number of persons were covered by both public and private plans and, thus, were included in both categories. See table 5 for persons covered by public plans.

⁴Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting of Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage.

Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents who were reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. These reclassified respondents were excluded in the tabulation of *Uninsured for more than a year* using method 1 in 2004. See "Technical notes" for additional information.

DATA SOURCE: Family Core component of the 2004 National Health Interview Survey.

Technical Notes

Estimation procedures

NCHS creates survey weights for each calendar quarter of the NHIS sample. The NHIS data weighting procedure has been described in more detail elsewhere ([view/download PDF](#)). Estimates were calculated by using the NHIS survey weights, which are calibrated to census totals for sex, age, and race/ethnicity of the U.S. civilian noninstitutionalized population. The weights for the 1997–99 NHIS data were derived from 1990 census-based population estimates. Weights for the 2000–04 NHIS data were derived from 2000 census-based population estimates. For the State-level estimates, these same national survey weights were also used. Special State-level weighting was not used in the calculation of the State-level estimates.

Point estimates and estimates of their variances were calculated using SUDAAN software to account for the complex sample design of the NHIS. The Taylor series linearization method was chosen for variance estimation. All estimates shown meet the NCHS standard of having less than or equal to 30% relative standard error. Differences between percentages or rates were evaluated using two-sided significance tests at the 0.05 level. Logistic regression was used to evaluate the significance of trends in the percentage of health insurance coverage. Terms such as “greater than” and “less than” indicate a statistically significant difference. Terms such as “similar” and “no difference” indicate that the estimates being compared were not significantly different. Lack of comments regarding the difference between any two estimates does not necessarily mean that the difference was tested and found to be not significant.

Definitions of selected terms

Health insurance coverage—The “private health insurance coverage” category excludes plans that paid for only one type of service such as

accidents or dental care. The “public health plan coverage” category includes Medicaid, State Children’s Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, Medicare (disability), and military plans. A small number of persons were covered by both public and private plans and were included in both categories. A person was defined as *uninsured* if he or she did not have any private health insurance, Medicare, Medicaid, SCHIP, State-sponsored or other government-sponsored health plan, or military plan at the time of the interview. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care. The analyses excluded persons with unknown health insurance status (about 1% of respondents each year).

The data on health insurance status were edited using an automated system based on logic checks and keyword searches. For comparability, the estimates for all years were created using these same procedures. The resulting estimates of health insurance coverage are generally within 0.1–0.3 percentage points of those based on the editing procedures used for the final data files.

The terms HIKIND, MCAREPRB, and MCAIDPRB refer to questions on the NHIS. The data on type of health insurance are collected through the HIKIND question “*What kind of health insurance or health care coverage does - - have? INCLUDE those that pay for only one type of service (nursing home care, accidents, or dental care), exclude private plans that only provide extra cash while hospitalized.*” Respondents can indicate private and public plans or indicate that they or family members are not covered by insurance.

Two additional questions were added to the health insurance section of the NHIS beginning with quarter 3 of 2004. One question, MCAREPRB, was asked of persons 65 years and over who had not indicated that they had Medicare. The MCAREPRB

question is: “*People covered by Medicare have a card which looks like this. {Are/Is} {person} covered by Medicare?*” The other question, MCAIDPRB was asked of persons under age 65 who had not indicated any type of coverage. The MCAIDPRB question is: “*There is a program called Medicaid that pays for health care for persons in need. In this state it is also called {state name}. {Are/Is} {person} covered by Medicaid?*”

Respondents who were considered insured at the time of interview were asked about periods of noncoverage in the past year. For persons who did not have health insurance at the time of interview, a question concerning how long since the respondent had coverage was asked. These questions were used in the estimates of intermittent and long term uninsurance.

Respondents who originally classified themselves as uninsured, but whose classification was changed to Medicare or Medicaid on the basis of a “yes” response to either probe question, subsequently received appropriate followup questions concerning periods of noncoverage for insured respondents.

Method 1 estimates are based solely on one question (HIKIND). *Method 2* estimates are based on responses to three questions (HIKIND, MCAREPRB, and MCAIDPRB). Prior to 2004, estimates in earlier releases of this report were generated using Method 1. Beginning with this release, estimates for 2004 are presented using both Method 1 and Method 2. Estimates using Method 1 for the “Uninsured for more than a year” measure excluded persons whose classification was changed from uninsured to either Medicare or Medicaid by either additional probe question. These respondents did not receive the followup question concerning how long had it been since they had coverage because the survey instrument gave these respondents the questions concerning noncoverage for insured persons.

Of the 892 people (unweighted) who were eligible to receive the

MCAREPRB question in quarters 3 and 4 of 2004, 55.4% indicated that they were covered by Medicare. Of the 9,146 people (unweighted) who were eligible to receive the MCAIDPRB question in quarters 3 and 4 of 2004, 3.0% indicated that they were covered by Medicaid.

From July through December 2004 (quarters 3 and 4 combined), the estimates (weighted) for the “*uninsured at the time of interview*” measure decreased from 10.4% to 9.9% for persons under 18 years of age, from 19.7% to 19.5% for adults 18–64 years of age, and from 1.7% to 1.2% for persons 65 years of age and over with the use of Method 2 (table I). The estimates for public coverage increased from 28.1% to 29.6% for children under 18 years of age, from 11.3% to 11.4% for adults 18–64 years of age, and from 89.5% to 93.3% for persons 65 years of age and over with the use of Method 2 (table II). In the tabulation of “*uninsured for more than a year*” using Method 1, respondents whose classification was changed to Medicare or Medicaid by either probe question were excluded from the analysis because these individuals did not receive the question concerning duration of noncoverage for persons who are uninsured. There is no impact on the two additional questions on the estimates for private coverage.

Education—The categories of education are based on the years of school completed or highest degree obtained for persons aged 18 years and over. Only years completed in a school that advances a person toward an elementary or high school diploma, General Educational Development high school equivalency diploma (GED), college, university, or professional degree are included. Education in other schools or home schooling is counted only if the credits are accepted in a regular school system.

Employment—Employment status is assessed at the time of interview and is obtained for persons aged 18 years and over. In this release, it is presented only for persons aged 18–64 years.

Hispanic or Latino origin and race—Hispanic or Latino origin and race are two separate and distinct categories. Persons of Hispanic or Latino origin may be of any race. Hispanic or Latino origin includes persons of Mexican, Puerto Rican, Cuban, Central and South American, or Spanish origins. Race is based on the family respondent’s description of his or her race background as well as the race background of each family member. For conciseness, the text, tables, and figures in this report use shorter versions of the 1997 Office of Management and Budget (OMB) race and Hispanic or Latino origin terms. For example, the category “not Hispanic or Latino, black or African American, single race” is referred to as “non-Hispanic black, single race” in the text, tables, and figures. Estimates of non-Hispanic persons of races other than white only or black only or of multiple races are combined into the “other races or multiple race” category.

Poverty status—Poverty categories are based on the ratio of the family’s income in the previous calendar year to the appropriate poverty threshold (given the family’s size and number of children) defined by the U.S. Census Bureau for that year (1–8). Persons who are categorized as poor had a ratio less than 1.0 (i.e., their family income was below the poverty threshold), near poor persons have incomes of 100% to less than 200% of the poverty threshold, and not poor persons have incomes that are 200% of the poverty threshold or greater. The remaining group of respondents is coded as “unknown” with respect to poverty status. The percentage of respondents with unknown poverty status (19.1% in 1997, 23.6% in 1998, 26.4% in 1999, 27.0% in 2000, 27.1% in 2001, 28.1% in 2002, 31.5% in 2003 and 28.2% in 2004) are disaggregated by insurance status and age in tables 4, 5, and 6. See the NHIS Survey Description Documentation for 1997–2003 for more information on the unknown income and unknown poverty status categories (<http://www.cdc.gov/nchs/nhis.htm>).

Region—In the geographic classification of the U.S. population, States are grouped into the following four regions used by the U.S. Census Bureau:

<i>Region</i>	<i>States included</i>
Northeast	Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and Pennsylvania
Midwest	Ohio, Illinois, Indiana, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Kansas, and Nebraska
South	Delaware, Maryland, District of Columbia, West Virginia, Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Oklahoma, Arkansas, and Texas
West	Washington, Oregon, California, Nevada, New Mexico, Arizona, Idaho, Utah, Colorado, Montana, Wyoming, Alaska, and Hawaii

Future plans

The NCHS Early Release Program will continue to update and release estimates of health insurance coverage 6 months after NHIS data collection has been completed for each quarter. In addition to this special report focusing on health insurance, the Early Release Program also releases estimates for other selected measures of health, including usual place to go for medical care, obtaining needed medical care, influenza vaccination, pneumococcal vaccination, obesity, leisure-time physical activity, current smoking, alcohol consumption, HIV testing, general health status, personal care needs, serious psychological distress, diagnosed diabetes, and asthma

episodes (9). Health insurance data are available in this report, which focuses on health insurance, as well as the regular Early Release report (9). New measures may be added as work continues and in response to changing data needs. Feedback on this release is welcome (**e-mail**).

Announcements about Early Releases, other new data releases, publications, or corrections related to the NHIS will be sent to members of the HISUSERS Listserv. To join, visit the CDC Web site

¹A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care.

²A year is defined as the 12 months prior to interview.

³Poverty status is based on family income and family size using the U.S. Census Bureau's poverty thresholds. "Poor" persons are defined as those below the poverty threshold, "near poor" persons have incomes of 100% to less than 200% of the poverty threshold, and "not poor" persons have incomes of 200% of the poverty threshold or greater. The percentage of respondents with unknown poverty status was 27.7% in July-December 2004. See the NHIS Survey Description Document for years 1997-2003 (<http://www.cdc.gov/nchs/nhis.htm>) for more information on the unknown income and poverty status categories.

⁴Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 years with no reported coverage were asked explicitly about Medicaid coverage. Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. These reclassified respondents were excluded in the tabulation of "Uninsured for more than a year" using Method 1 in 2004. See "Technical notes" for additional information.

DATA SOURCE: Family Core component of the 2004 National Health Interview Survey. The estimates for 2004 were based on data collected from July through December.

¹Poverty status is based on family income and family size using the U.S. Census Bureau's poverty thresholds. "Poor" persons are defined as those below the poverty threshold, "near poor" persons have incomes of 100% to less than 200% of the poverty threshold, and "not poor" persons have incomes of 200% of the poverty threshold or greater. The percent of respondents with unknown poverty status was 27.7% in July - December 2004. See the NHIS Survey Description Document for years 1997-2003 (<http://www.cdc.gov/nchs/nhis.htm>) for more information on the unknown income and poverty status categories.

²Beginning in quarter 3 of 2004, two additional questions were added to the NHIS insurance section to reduce potential errors in reporting Medicare and Medicaid status. Persons 65 years and over not reporting Medicare coverage were asked explicitly about Medicare coverage, and persons under 65 with no reported coverage were asked explicitly about Medicaid coverage. Estimates of uninsurance for 2004 are calculated without using the additional information from these questions (noted as Method 1) and with the responses to these questions (noted as Method 2). Respondents who were reclassified as covered by the additional questions received the appropriate followup questions concerning periods of noncoverage for insured respondents. See "Technical notes" for additional information.

³The category "public health plan coverage" includes Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, Medicare (disability), and military plan. A small number of persons were covered by both public and private plans and, thus, were included in both categories. See table 6 for persons covered by private plans.
